

**Supplemental Figure 2.1.** Mean Stabilized Weights Over Follow-up Time in (A) CD and (B) UC. The increase in the weights that occurs near month 96 in both treatment groups in the CD analysis is attributed to the combination of Medicaid and Medicare data sets allowing for a small subset of the population who had both Medicaid and Medicare benefits and had much longer follow-up time than the other cohort members. Note that the UC analysis included only Medicare beneficiaries.

Mean Stabilized Truncated Weights by Month of Follow-up UC patients
