

TABLE S4 Results of ATE Estimates from the Single Covariate Simulation Study Setting 4:
 $\{\gamma_0, \gamma_1, \gamma_2, \gamma_3\} = \{1, 0.15, 0.7, 0\}$.

Method	Sample Size	RMSE	MAE	Bias	Rc	SE _{avg}	SE _{emp}
GPMatch	100	0.226	0.140	0.022	0.97	0.238	0.226
	200	0.164	0.105	0.024	0.98	0.169	0.163

RMSE = root mean square error; MAE = median absolute error; Bias = Estimate-True; Rc = Rate of coverage by the 95% interval estimate;

SE_{avg} = average of standard error estimate from all replicate; SE_{emp} = standard error of ATE estimates from all replicate;

GPMatch: Bayesian structural model with Gaussian process prior, only treatment effect is included in the mean function; covariance function includes X .

QNT_PS: Propensity score sub-classification by quintiles.

AIPTW1 & AIPTW2: augmented inverse probability of treatment weighting.

LM_PS1 & LM_PS2: linear regression modeling with propensity score adjustment;

LM_sp(PS1) & LM_sp(PS2): linear regression modeling with spline fit propensity score adjustment;

BART: Bayesian additive regression tree.

Propensity scores are estimated using different logistic models, with AIPTW1, LM_PS1 & LM_sp(PS1) use PS estimated using logistic model $\logit A \sim X$; and AIPTW2, LM_PS2 & LM_sp(PS2) use PS estimated using logistic model $\logit A \sim X^{1/3}$. QNT_PS using either PS estimates produces identical results.
