Table A2: Comparative treatment effects. Effect sizes reflect between-group pairwise comparisons adjusted for covariates in the final mixed effects general linear model (95% confidence interval). Rows labeled "treatment" and "6-month" show the post-treatment and follow-up scores relative to pre-treatment scores, respectively. A positive between-group difference for the MAL means that the group listed first in the comparison showed greater gains in arm use. A negative between-group difference for the WMFT means that the group listed first in the comparison showed greater gains. Statistically significant contrasts are indicated with an *. Clinically meaningful differences between groups are italicized.

	Gaming+ vs CIMT	Gaming vs CIMT	Gaming+ vs Standard Care	Gaming vs Standard Care	Gaming+ vs Gaming	CIMT vs Standard Care
